 実習	Device monitor . . . . .	2-5
 実習	Symbol monitor . . . . .	2-7

## Image of status observation

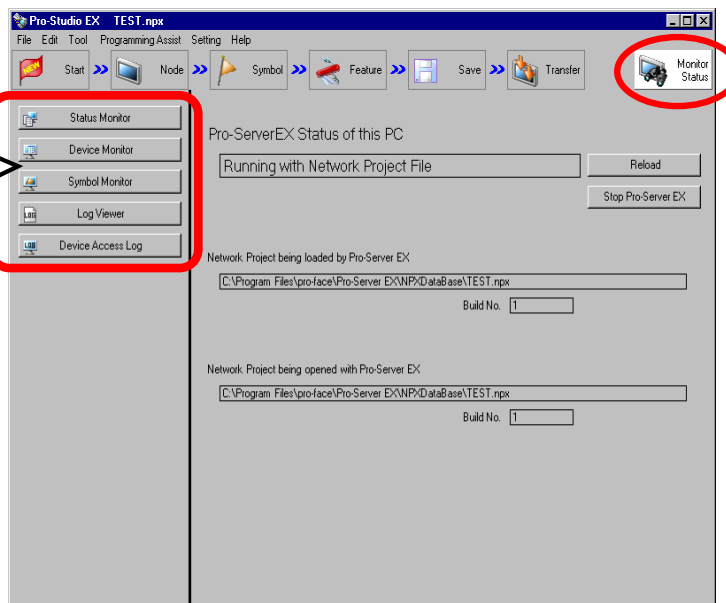

By using the status observation tool, status of participating node and the data of PLC device can be monitored in PC when the basic setup (participating node, symbol registration and NPX save) is done.

Refer to the Reference Manual "Chapter 27 Field status to be confirmed easily" for each details.

Here, above mentioned three monitors will be used for practical work.

### One point

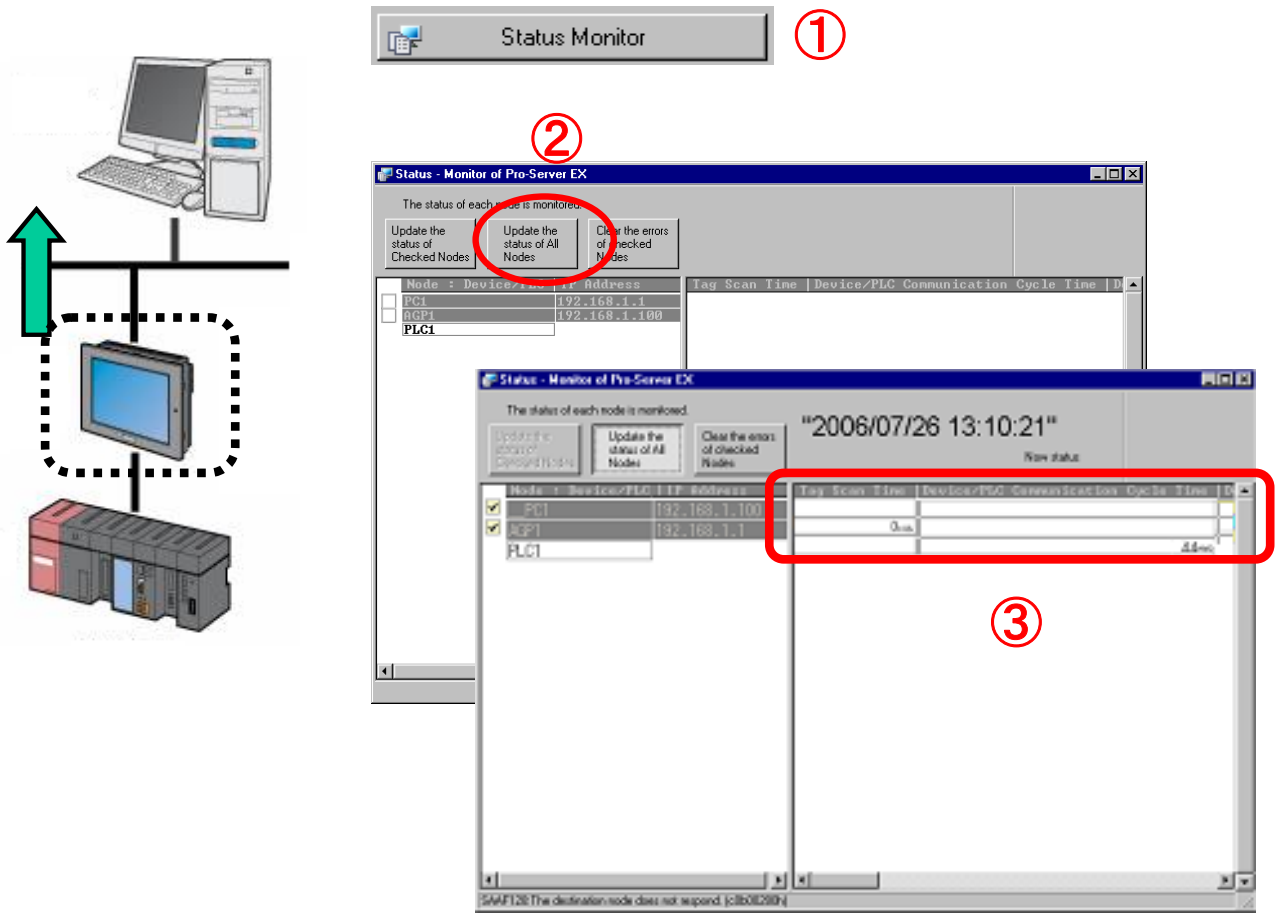

Use as a debug tool

The device monitor and symbol monitor can also be used as a debug tool. Since On-off of bit and change of numerical data are possible from/in PC without using PLC ladder tool, debug of display indicator screen and network project file (NPX) is possible.

# Status monitor

Status of each participating node is monitored.

- ① Click the [Status monitor].
- ② The window of “Status-Monitor of Pro-Server EX” is displayed.  
Click the “Update the information of all nodes”.
- ③ The status of each display item on the right-hand side of the window is updated.

The following items are displayed.

Tag scan time, Device communication cycle time, Device communication error count, Device communication error number, Error time, 2WAY error number, System version, 2WAY version, Protocol version, Model.

 One point

When NPX is not yet saved, save it by the following procedure.

① If the message as shown above is displayed, click [Yes].

② Enter the place and the file name to be saved, and save NPX.

※In practical work, save it as a "TEST.NPX".

③ Click [OK].

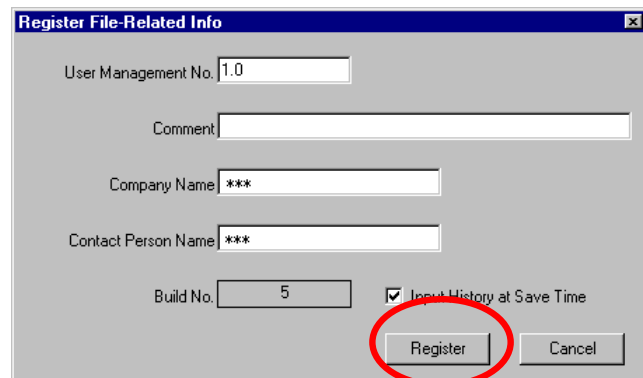

At the time of reload, start the Pro-Server EX, the icon will display in task tray.

③

④ In "Register file related information", enter as follows and click the [Register].

User management number:  
1.0  
Comment : No  
Company name: \*\*\*  
(As per PC setup )  
Contact person name: \*\*\*  
(As per PC setup )

④

Device monitor

Data of PLC device address is monitored.

From the symbol sheet created to each participating node, the data of the continuous following addresses can be read and written by specifying the first address.

Address	+00	+01	+02	+03	+04	+05	+06	+07	+08
000050	0	0	0	0	0	24	24	24	24
000058	0	0	0	0	0	0	0	0	0
000060	0	0	0	0	0	0	0	0	0
000077	0	0	0	0	0	0	0	0	0
000086	0	0	0	0	0	0	0	0	0
000085	0	0	0	0	0	5	7	4	0
000104	0	0	0	0	0	0	0	0	0
000113	0	0	0	0	0	0	0	0	0
000122	0	0	0	0	0	0	0	0	0
000131	0	0	0	0	0	0	0	0	0
000140	0	0	0	0	0	0	0	0	0
000149	0	0	0	0	0	0	0	0	0
000158	0	0	0	0	0	0	0	0	0
000167	0	0	0	0	0	0	0	0	0
000176	0	0	0	0	0	0	0	0	0
000185	0	0	0	0	0	0	0	0	0
000194	0	0	0	0	0	0	0	0	0

- ① If Device monitor is clicked, the window of “Device-Monitor of Pro-Server EX” is displayed.
- ② Select participating node.
- ③ Select connection unit.
- ④ Select first device from symbol sheet.
- ⑤ Data of continuous address will be displayed in the window.

⑥ If display cell of each data is double clicked, the window as shown in the right figure will be displayed and the data can be written.

※ Refer to the appendix for the details regarding the screen for practical work.

★ One point

- The size of a window can be changed and it can be made in easily viewable form.

The screenshot shows the 'Monitor of Pro-Server EX' window. It features a table with columns for addresses and data values. A callout box with a green border points to the window's frame, containing the text: 'The frame of a box will drag and the number of devices to be monitored and the direction of view can be changed by changing the size.'

Address	+00	+01	+02	+03	+04	+05	+06	+07	+08
D00050	0	0	0	0	0	24	24	24	24
D00059	0	0	0	0	0	0	0	0	0
D00060	0	0	0	0	0	0	0	0	0
D00077	0	0	0	0	0	0	0	0	0
D00086	0	0	0	0	0	0	0	0	0
D00095	0	0	0	0	0	5	7	4	0
D00104	0	0	0	0	0	0	0	0	0
D00113	0	0	0	0	0	0	0	0	0
D00122	0	0	0	0	0	0	0	0	0
D00121	0	0	0	0	0	0	0	0	0
D00140	0	0	0	0	0	0	0	0	0
D00149	0	0	0	0	0	0	0	0	0
D00158	0	0	0	0	0	0	0	0	0
D00167	0	0	0	0	0	0	0	0	0
D00176	0	0	0	0	0	0	0	0	0
D00185	0	0	0	0	0	0	0	0	0
D00194	0	0	0	0	0	0	0	0	0

Multiple data can be written in lump sum to continuous address.

In this portion ...

Example) If symbol is selected and the following is written

100 150 250 180 200 ... (press [ENTER] key)

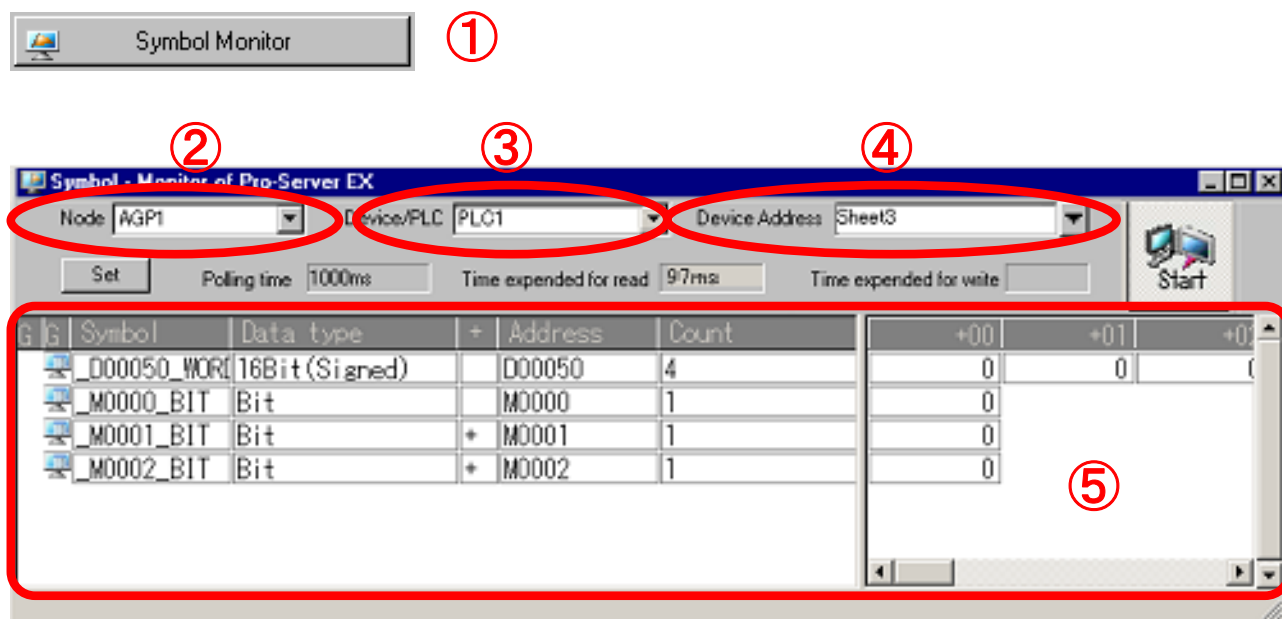

Single byte space  
Written as

Address: D50 D51 D52 D53 D54 ....  
          ||    ||    ||    ||    ||  
Input value: 100 150 250 180 200 ....

## Symbol monitor

Data of PLC device address is monitored in the same way as Device monitor. In symbol monitor, only the registered data of symbol sheet can be displayed and only the items which are to be displayed from discontinuous device can be displayed by selecting them.

- ① If symbol monitor is clicked, the window of “Symbol-Monitor of Pro-Server EX” will be displayed.
- ② Select the participating node.
- ③ Select the connection unit.
- ④ Select the symbol sheet.
- ⑤ The data for each symbol will be displayed in window.

⑥ If display cell of each data is double-clicked, the window as shown in the right figure will be displayed and the data can be written.

⑥

※ Refer to the appendix for the details regarding screen for practical work.

 One point

Regarding DDE monitor

The device data of connection unit can be read on the Microsoft Excel sheet. The sheet for various monitors can be created by using the features such as functions and graph display provided by Excel.

Example) The result in which data is **calculated by function**, will display.

Output 1	100	Weight A	Weight B	Standard	OK or NG
Output 2	120	50	80	100	=IF(B3+C3 > D3, "OK", "NG")
Output 3	130	40	20	150	NG
Output 4	150	50	500	180	OK
Output 5	180	60	30	150	NG
Total	=SUM(C2:C6)	10	40	170	NG

Example) Observe the real time change in/by moving graph. (Created with Excel graph wizard)

Symbol	Data Type	Consecutive	Device Address	No.
D00050_WORD	Edit		D00050	4
_M0000_BIT	Delete		M0000	1
_M0001_BIT	Copy		M0001	1
_M0002_BIT	Cut		M0002	1
	Paste			1
	Group			1
	Symbolize Address			1
	Make Symbol Macro			1
	Device Monitor			1

①

②

① Right click the device which is monitoring DDE from symbol sheet, point out it in order of "Make symbol macro" and "EXCEL" and click the "DDE".

② Created DDE function will be stuck on the cell of a cell from a clip board.

★ One point

What is DDE (Dynamic Data Exchange) ?

The application software on Windows is the structure which exchanges the data. A user does not need to do any special operation and the software will transfer the data automatically. The side which demands data is called as DDE client and the side which provides the data is called as DDE server.

If DDE function is set up by Pro-StudioEX, Pro-Server EX will consider as DDE server automatically, and Excel will consider as DDE client. (Data can not be written in Excel without DDE server feature.)

In DDE monitor, data is observed in Excel sheet which is always opened.
